

## **Fork Positioner for Forklifts**

Fork Positioner for Forklift - A fork positioner is a device made out of high quality materials intended to endure the most demanding procedures and work environments. This piece of equipment can enable drivers to control the blades hydraulically without leaving the seat. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate much more precise lifting and position in a faster and much more effective way.

The fork pocket is rather unique and enables the person operating it to be able to safely swing the blades into position without any worry of damaging the positioning cylinders. This allows the operator the option to be able to perform independent or simultaneous fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into fork positioners on available units.
